

Python for Data processing

Lecture 2:

Arrays, tensors and computations - Part II

Gleb Ivashkevich

What we already know

A lot about numpy arrays:

- creation
- indexing
- universal functions
- linear algebra
- best practices
- I/O

Why numpy is not enough

numpy arrays are great but:

- they work only on CPU
- they provide only basic building blocks

For deep learning:

- CPU/GPU/TPU/?
- gradients

PyTorch

- **tensors** provide the same operations as **numpy** arrays
- work on CPU/**GPU**/**TPU**
- provide **autogradients**
- **deep learning** building blocks
- efficient **data loading**
- **deployment**

PyTorch tensors

Tensors

- similar to arrays, provide the same computational facilities
- can **share** data
- can live on **different devices**
- provide **declarative** computations

→let's try it out!

Tensors and storage

Devices and computations

→let's try it out!

View, copies, reshaping

PyTorch is a bit more elaborated:

- **view**: always returns a view or fails
- **reshape**: returns either view or new tensor
- depends on contiguity constraints

→let's try it out!

Gradients

In deep learning we need **gradients**:

- to calculate updates to network parameters (weights)
- no way to do that in NumPy
- an easy go in PyTorch (a bit more elaborated in Tensorflow)

$$L(a_{ij}) \text{ (scalar)} \rightarrow \frac{\partial L}{\partial a_{ij}} \text{ (tensor)}$$

→let's try it out!

Logistic regression with PyTorch

Logistic regression: setup

- **two-dimensional** input (created with `make_blobs` from `sklearn.datasets`)
- **binary** classification with **linear** decision boundary
- output: **sigmoid**
- from **scratch**

Log loss

class labels

sigmoid
output

good

bad

We want: probability ↓ for class 0, probability ↑ for class 1

→let's try it out!

What we've learned

- **numpy** broadcasting
- how to use **numpy** efficiently
- PyTorch tensors and gradients
- how to perform simple gradient descent

Words we know

- Jupyter
- numpy
- PyTorch

Assignment

- explore NumPy broadcasting and linear algebra
- reimplement logistic regression with PyTorch deep learning building blocks

questions?
